

# SSP17 Wireless Switch Panels

Tap Switch Panel Info (from the Settings page) to access the status page for your wireless switches.

The Wireless Graphic and color-coded Signal Strength Value will identify the status of a wireless switch panel.

- Green – 100 and above (Strong)
- Yellow – 86-99 (Medium)
- Red – Less than 85 (Weak)

Green = Strong Signal

- Red Wireless Graphic with a Zero reading – The switch is currently disconnected from the screen. It is likely that the battery inside your switch panel needs replaced. The wireless switch panel in your coach will illuminate a green LED whenever a button is pressed. If the LED on your switch panel does not illuminate when you press a button on your switch, you will need to replace the 2032 coin cell battery.

# Wireless Switch Pairing

If you've replaced the battery and the switch still will not work, you might need to pair the switch panel to the screen.

- 1 Tap the wireless graphic for the switch you'd like to program.
- 2 Tap Start Pairing. You'll have 30 seconds to press and hold any 2 buttons on the switch panel at the same time for 5 seconds.
- 3 Tap Done once the pairing successful message appears. It may take up to 10 minutes for the battery switch indicator to turn Green, but the switch should work instantly once paired.

If at this point a switch still fails to work, press and hold "Clear" (not pictured) for 3 seconds on the Wireless Switch Pairing Procedure screen, then try the pairing procedure once again.
