1. INTRODUCTION

1.1 Victron energy

Victron Energy has established an international reputation as a leading designer and manufacturer of power systems. Our R&D department is the driving force behind this reputation. This department is continually seeking new ways of incorporating the latest technology in our products.

A Victron Energy power system can supply high-quality energy at places where there is no permanent mains power source available.

An automatic stand alone operating energy supply system can consist of: a Victron Energy inverter, a Victron Energy battery charger, if required a Victron Energy Mains Manager and batteries with sufficient capacity.

Our equipment can be used in numerous situations, in the field, on ships and in other places where mobile power is indispensable.

Victron Energy equipment can be used for all kinds of electrical appliances for household, technical and administrative purposes and instruments susceptible to interference.

1.2 The Titan Generation charger

This manual contains directions for installing the following types of battery chargers: the Pallas-TG 12/50, the Skylla-TG 24/30 including the 24/30 110V, the Skylla-TG 24/50 and the Titan 48/25. It describes the functionality and operation including their protective devices and other technical features.

1.3 Warnings

The cover of the battery charger may only be removed by a qualified technician. Before obtaining access to the battery charger the mains supply circuit must be disconnected.

Explosive gasses can occur during charging a lead-acid battery. Prevent flames and sparks.
Provide adequate ventilation during charging.

The battery charger can not be used to charge non-rechargeable batteries.

There is a dangerous voltage present on some of the metal parts inside the battery charger.

The battery charger is NOT protected against reverse battery polarity. ("+" connected to "-" and "-" connected to "+"). Follow the installation procedure. The warranty expires when the battery charger becomes defective due to reverse battery polarity.

The on/off switch at the front of the cabinet does not switch off the mains supply.

Disconnect the mains supply before making or breaking the connections to the battery.

Do not use the voltage-sense facility in combination with the diode-splitter compensation. This will raise the output voltage, which could damage the battery.

2. DESCRIPTION

2.1 The Titan battery charger

The Titan battery charger is a fully automatic charger for 12V, 24V or 48V batteries and is powered by a mains voltage of 230Vac, 50Hz or 110Vac, 50 Hz for the Skylla-Tg 24/30 110V. It charges the battery according to the IUoUo characteristic, which is a 3-stage charging characteristic. This characteristic is shown in illustration 1. While charging, the Titan continuously measures the battery voltage and current and bases the charging voltage and current on the measured values.

Illustration 1.
The IUoUo charge
characteristic.

Type	Boost voltage	Float voltage	Minimal voltage
12V / 50A	14,25 Vdc	13,25 Vdc	12,5 Vdc
24V / 30A	28,5 Vdc	26,5 Vdc	25 Vdc
24V / 30A 110V	28,5 Vdc	26,5 Vdc	25 Vdc
24V / 50A	28,5 Vdc	26,5 Vdc	25 Vdc
48V / 25A	57 Vdc	53 Vdc	50 Vdc

Assuming that the battery is discharged, the Titan charger starts charging in the boost-charge mode. In this mode the battery is charged until the battery voltage reaches the boost voltage. At this point the battery is charged to approximately 80% of its maximum capacity. This is the end of the boost-charge mode and the Titan charger automatically switches to the equalize-charge mode.

During the equalize-charge mode the charging voltage stays the same as the boost voltage but the charge current slowly decreases. The duration of this mode is pre-selectable to 4, 8 or 12 hours. The standard time of the equalize-mode is 4 hours. After this time the Titan charger automatically switches into the float-charge mode.

In the float-charge mode the charge voltage changes into the float voltage and the charge current continues to decrease. This mode lasts for 20 hours.

After the float-charge mode the charger returns to the equalize-charge mode for 30 minutes, this is to compensate for the normal leakage or self discharge of the battery.

The Titan charger can remain connected to the battery continuously, without gas formation taking place, caused by overcharging. It is not necessary to disconnect the battery from the charger during long time storage, for example during the winter storage of a ship. The Titan charger will keep your battery in optimum condition under all circumstances and will prolong the lifetime of your battery.

A parallel load connected to the battery can cause a voltage drop. The Titan charger automatically switches into the boost-charge mode when the battery voltage drops below the minimal voltage.

The Titan charger is equipped with a separate starter-battery connection to charge an extra battery, like a starter-battery. You can use this battery for starting machines, like a boat engine for this application.

The Titan charger has a stabilised output voltage. Therefore the Titan charger can also be used as a DC power supply in applications where no battery is present.

2.2 The battery

The Titan charger can charge various batteries. The recommended battery capacity is indicated in the table below:

Type	Recommended capacity
12/50	200 - 400 Ah
24/30	100 - 200 Ah
24/30 110V	100 - 200 Ah
24/50	200 - 400 Ah
48/25	100 - 200 Ah

The charge voltages of the Titan charger are factory set. Most battery manufactures recommend these charging voltages for optimal charging of 12V, 24V or 48V lead-acid batteries.

It is possible to charge different types of batteries, like traction batteries. To charge these batteries the charging voltages of the charger have to be changed. Contact your Victron Energy dealer or battery dealer for more details about the recommended charging voltages.

2.3 Protection

The battery charger is safe to use due to its robust design and its internal electronic protection. This chapter describes the various internal electronic protective devices.

Maximum charge current protection

- ❑ The battery charger provides a maximum charge current of 30A for the 30A models or 50A for the 50 A models. This level is electronically limited and is factory set.
- ❑ The maximum output current can also be limited by using an external potentiometer-panel, the Victron Energy COV panel.

Short circuit protection

- ❑ The charger output is protected against short-circuits. The short-circuit current is electronically limited at 30A or 50A, according to the model. In this condition the output voltage approaches 0 Volt. The battery charger resumes normal operation when the short circuit is removed.
- ❑ The short circuit current can also be reduced by the Victron Energy COV panel.

Input protection

- ❑ The charger mains-input is protected with a fuse.
- ❑ The charger will not be damaged by using input voltage between 0 and 300 Vac.
- ❑ The charger will not be damaged by using input voltage frequency between 0 and 65 Hz.

Over voltage protection

- ❑ The charger switches off automatically when the battery voltage becomes higher than the over voltage value. The charger switches back on when the battery voltage becomes less than the raise value. See the table below.

Model	Over voltage value	Raise value
12V	19,1 Vdc	18,1 Vdc
24V	35,5 Vdc	33,5 Vdc
48V	68,1 Vdc	64.1 Vdc

- ❑ The charger output is protected with a fuse.

Starter battery protection

- ❑ The output current of the starter battery output is electronically limited at 4A. The starter battery output is also protected against wrong connections by means of a 10A fuse.

Temperature protection

- ❑ The internal temperature of the charger is measured continuously. However, due to a high ambient temperature outside the cabinet the temperature within the battery charger can rise. When the external temperature of the battery charger becomes higher than 40°C, the output current decreases and the Failure led flashes.
- ❑ Before the internal temperature becomes too high due to extreme conditions the charger switches off and the Failure led illuminates continuously. The charger resumes operation when the internal temperature is restored within limits.

Voltage-sense protection

- ❑ When the voltage-sense facility is used the charger automatically decreases the output voltage when the voltage loss over the battery cables is more than 2 Volt in total.

Battery watchdog timer

- ❑ The charger is equipped with a battery watchdog timer. This timer measures the duration of the boost mode. The moment the boost mode lasts longer than 10 hours, the charger will switch to float mode. The charging voltage will then become the float voltage. In this way it is prevented that a defective battery is needlessly charged with a high charging voltage.

3. DIRECTIONS FOR USE

3.1 Installation

Find a dry and well-ventilated area to mount the Titan charger and battery. Keep the distance between the charger and the battery less than 6 meters.

The charger may be wall or floor mounted. Mounting on a wall improves the air circulation within the charger cabinet and will prolong the lifetime of the battery charger.

The holes for the mains cable, the battery connections, the remote connections and the earth connection are located at the bottom of the battery charger housing, see illustration 2.

Connecting earth

Connect the earth screw to a real earth-point. Connections to earth have to be according to applicable safety standards.

- ☐ On a ship: Connect the earth screw to the earth plate or to the hull of the ship.
- ☐ On land: Connect the earth screw to the earth of the mains.
- ☐ Mobile applications (a vehicle, a car or a caravan): Connect the earth screw to the frame of the vehicle.

Connecting the battery

The connections between the Titan charger and the battery are essential for a good operation of the charger. Therefore the battery connections need tightening well. It is important to use short and thick battery cables to minimise the voltage losses in the cable. Cable resistance decreases accordingly as the cables become shorter and thicker. Therefore it is not recommended to use cables longer than 6 meters. The table below shows the recommended cable core thickness.

Type	core diameter of cables until 1,5m	core diameter of cables between 1,5m and 6m
12/50	10 mm ²	16 mm ²
24/30	6 mm ²	10 mm ²
24/30 110V	6 mm ²	10 mm ²
24/50	10 mm ²	16 mm ²
48/25	6 mm ²	10 mm ²

The Titan is NOT protected against reverse battery polarity. ("+" connected to "-" and "-" connected to "+"). Follow the installation procedure. The warranty expires when the Titan becomes defective due to reverse polarity.

Disconnect the mains supply before making or breaking the connections to the battery.

The on/off switch at the front of the cabinet does not switch off the mains supply.

The battery connection sequence

- ☐ Check if the charger is switched off and if the mains supply is disconnected.
- ☐ Remove the front of the battery charger to access the battery connections.
- ☐ If placed, remove all output fuses, see illustration 3.
- ☐ Connect the positive battery-cable (+) to the positive battery connection terminal on the charger printed circuit board, see illustration 3.
- ☐ Connect the negative battery-cable (-) to the negative battery connection terminal on the charger printed circuit board, see illustration 3.
- ☐ Check if the green led illuminates, see illustration 3. If the red led illuminates the positive and negative battery cables have been reversed.
- ☐ Place all output fuses.

The battery disconnection sequence

- ☐ Switch off the charger.
- ☐ Disconnect the mains supply.
- ☐ Disconnect the negative battery-cable.
- ☐ Disconnect the positive battery-cable.

*Illustration 3.
Location of the
battery connections*

Connecting the starter battery

The starter battery has to be connected using wire with a core of at least 1.5 mm².

- ❑ Connect the positive (+) battery-pole to the right side of the starter battery connector, see illustration 3.
- ❑ Connect the negative (-) battery-pole to the left side of the starter battery connector, see illustration 3.

Connecting the mains

- ❑ Check if the battery is already connected to the charger.
- ❑ Remove the front of the battery charger to access the AC input connector.
- ❑ Connect the mains PE cable (green/yellow) to the AC input connector located on the circuit board, see illustration 4.
- ❑ Connect the mains neutral cable (blue) to the AC input connector.
- ❑ Connect the mains line cable (brown) to the AC input connector.
- ❑ Plug the mains cable into the mains socket. Make sure that the mains socket is connected to earth. The connection to the earth of the mains has to be according to applicable safety standards.

*Illustration 4.
Location of the
AC input connector.*

3.2 Operation

Located on the front of the Titan charger are an on/off switch and three rows of LED's, as shown in illustration 5.

The battery charger can be switched on and off with the on/off switch.

The “output voltage” LED's indicate the output voltage value.

The “output current” LED's indicate the output current value.

The other LED's indicates the state of the charger.

Illustration 5. Example of the battery charger front panel.

The operation sequence:

Explosive gasses can occur during charging a lead-acid battery. Prevent flames and sparks.
Provide adequate ventilation during charging.

Switching the charger on with the on/off switch results in the following:

- ❑ The “on” led will flash for about 2 seconds. In these first 2 seconds the charger reads all input signals and calculates the necessary output voltage. After 2 seconds the charger will switch on and the “on” led illuminates.
- ❑ According to the condition of the battery the charger will start in the boost-charge mode or at float-charge mode. If the battery is not full the “boost” led illuminates and the charger will start boost-charging the battery.
- ❑ A dip switch can be used to set the charger so that it will always start charging in the boost mode, irrespective of the condition of the battery.
- ❑ When the battery voltage has reached the boost voltage the charger will change into the equalize-charge mode and the “equalize” led illuminates. This mode will last for a pre-selectable time of 4, 8 or 12 hours.
- ❑ After this time the charger will enter the float-charge mode and the “float” led will illuminate.

After the batteries are charged the Titan charger does not have to be switched off and the batteries can stay connected to the battery charger.

3.3 Maintenance

The Titan charger does not require any specific maintenance. However an annual check of the battery connections is recommended.

Keep the charger dry, clean and free of dust. If any problems arise, use the fault finding procedure to trace the fault, see chapter 5.

4. OPTIONS

The Titan charger is factory set to standard values. Some of these standard values can be changed by a qualified electrical technician into customised values. This chapter describes which values can be changed and how to change them.

 WARNING	The cover of the Titan may only be removed by a qualified technician. Before obtaining access to the Titan the mains supply circuit must be disconnected.
 WARNING	There is a dangerous voltage present on some of the metal parts inside the battery charger.
 CAUTION	Attention ! The value of the potmeters I, Vboost and Vfloat may only be adjusted by a qualified electrician. The remaining potmeters may not be adjusted at any case.

Opening of the battery charger cabinet

In order to change the standard values the front of the charger has to be removed.

- ☐ Remove the AC plug from the mains and wait two minutes.
- ☐ Unscrew the 4 screws on the front of the cabinet, see illustration 6.
- ☐ Remove the front panel of the battery charger.

Adjustments can be made by means of turning a potentiometer or by changing the position of a switch on the DIP-switch.

See illustration 7 for the location of the DIP-switch and the potentiometers.

Illustration 7.
Location of the DIP-switch and potentiometers.

Illustration 6.
Removing the front.

4.1 Permanent boost-charge

In some cases, for example when the battery is almost empty, it is recommended to permanent boost-charge the battery for 10 hours. Do not permanently boost-charge sealed lead-acid batteries. Contact your Victron Energy dealer or battery dealer for more information on charging the battery.

To set the charger into the permanent boost-charge mode:

- ☐ Place the DIP switch number 8 “R boost” to the left. In this mode the battery is being charged to the boost voltage.
- ☐ Do not permanent boost-charge the battery for longer than 10 hours as this can cause long term gas formation in the battery and will damage the battery.
- ☐ While a battery is being boost-charged, check the water level of the battery frequently and if necessary add distilled water to the battery.

4.2 Adjusting the charge voltage

The battery charger has a factory set float and boost voltage. The boost-voltage is always higher than the float-voltage. These charging voltages are the recommended values from almost every battery manufacturer. Before adjusting the charge voltage disconnect the temperature sensor and/or the voltage sense wires.

To change the float-voltage:

- ☐ Remove all batteries and other users that are connected to the output of the battery charger.
- ☐ Plug the AC plug into the mains and switch on the charger.
- ☐ Place DIP-switches 7 “Eq2” and 6 “Eq1” to the left position, this will reduce the equalize time to 0 hours. The charger switches into the float-charge mode.
- ☐ Place DIP-switch 4 “fine” to the left position in order to accurately adjust the output voltage.
- ☐ Measure the float-voltage on the charger output by using a precision voltage meter.
- ☐ Adjust the float-voltage by turning the “V float” potentiometer until the recommended voltage is reached.
- ☐ Correct the equalize time by moving DIP-switch 7 “Eq2” and 6 “Eq1”.
- ☐ Place DIP-switch 4 “fine” to the right position. In this position the output voltage is less sensitive to influence of temperature.

To change the boost-voltage:

- ❑ Place DIP-switch 7 “Eq2” to the right and place DIP-switch 8 “R boost” to the left. The charger switches into the boost-charge mode.
- ❑ Place DIP-switch 4 “fine” to the left position in order to accurately adjust the output voltage.
- ❑ Measure the boost-voltage on the charger output by using a precision voltage meter.
- ❑ Adjust the boost-voltage by turning the “V boost” potentiometer until the recommended voltage is reached.
- ❑ Replace DIP-switch 8 “R boost” to the right.
- ❑ Correct the equalize time by moving DIP-switch 7 “Eq2” and 6 “Eq1”.
- ❑ Place DIP-switch 4 “fine” to the right position. In this position the output voltage is less sensitive to influence of temperature.

4.3 Adjusting the equalize-charge mode time

The duration of the equalize-charge mode can be changed to fit the specifications of the battery. The duration of the equalize-charge mode can be set to 0, 4, 8 or 12 hours. When selecting 0 hours, the charger will skip the equalize-charge mode and will directly switch into the float-charge mode.

According to the table below the duration of the equalize-charge mode can be set by moving the DIP-switches 7 “Eq2” and 6 “Eq1” in the corresponding way :

8 R boost				
7 Eq,2				
6 Eq,1				
5 Split				
4 Fine				
3 Trac.				
2 Watch				
1 n/c				
	0 hours	4 hours	8 hours	12 hours

4.4 Diode-splitter charge voltage compensation.

If a diode-splitter (Victron Energy Argo) is connected to the Titan charger the charging voltage have to be raised to compensate for the voltage loss over the diode-splitter. If the voltage-sense option is used, it is not recommended to use the diode-splitter compensation. When both options are used simultaneously the output voltage will be too high.

To select the diode-splitter option:

- ❑ Place DIP switch 5 “split” to the left.

4.5 Traction battery compensation

If a Traction-battery is connected to the Titan charger the charge voltages have to be changed. The output voltage has to be raised to correctly charge the traction-battery. See the technical specifications for the traction charging voltages.

To set the charger into the traction mode:

- ☐ Place DIP-switch 3 “trac” to the left.

4.6 Use as a power-supply

The Titan charger can be used as a power supply without the obligation to connect a battery to the charger output.

To use the charger as a power supply:

- ☐ Put the charger into the permanent boost-charge mode, see chapter 4.1.
- ☐ Adjusted the output voltage to the desired voltage, see chapter 4.2.

With the above mentioned procedure the output voltage range is limited. When the full output voltage range is required please contact your Victron Energy dealer. See chapter 6.3 for details.

4.7 Use of a temperature sensor.

The temperature sensor supplied with the charger can be connected to the charger by using the 3 meter cable with stripped and tinned cable ends. This sensor should be mounted on the battery. The temperature sensor adjusts the charging voltage according to the battery temperature.

To connect the temperature sensor:

- ☐ Disconnect the mains,
- ☐ Connect the - (black wire) of the temperature sensor to the “-tmp” connector, see illustration 8.
- ☐ Connect the + (red wire) of the temperature sensor to the “+ tmp” connector, see illustration 8.
- ☐ Switch on the mains.
- ☐ If the temperature sensor is correctly connected the “TMP OK” on the printed circuit board led illuminates. If this led does not illuminate or flashes, the sensor is not connected correctly.

Illustration 8.
Location of the external connections.

4.8 Charging batteries with voltage sensing

Do not use the voltage-sense facility in combination with the diode-splitter compensation as this will raise the output voltage.

When high current runs through a thin cable between the charger and the battery there will be a voltage loss in the cables. The charging voltage measured at the battery poles will be lower than the specified voltage and this will result in a longer charging time. However, the charger is equipped with a voltage-sense facility. The battery voltage is exactly measured and the charger increases the output voltage to compensate for the voltage loss across the cables.

The charger can compensate for a maximum of 2V voltage loss over the cables. When the voltage loss is bigger than 2V the “on” led flashes and the failure led illuminates. The charge voltage will decrease until the voltage loss becomes maximum 2 Volt. The “on” led flashes and the failure led illuminates until the charger is manually switched off. When this occurs the battery cables have to be replaced because they are too thin or have bad connections.

To install the voltage-sense option:

- ☐ Disconnect the mains.
- ☐ Connect a red 0,75 mm² wire to the positive battery pole and the “+Vse” connector of the charger, see illustration 8.
- ☐ Connect a black 0,75 mm² wire between the negative pole of the battery and the “-Vse” connector of the charger, see illustration 8.
- ☐ For properly functioning both wires have to be connected.
- ☐ Switch on the mains.

The “VSE OK” led on the printed circuit board illuminates when connected correctly. If this led does not illuminate the voltage-sense wires are wrongly connected.

4.9 Intelligent startup

The factory setting of the charger is such that the battery voltage is checked when the charger is switched on (intelligent startup). In the case of a flat battery, the charger will start charging in the boost mode. If the battery voltage is sufficiently high during charger startup, the charger will be charging in the float mode.

In some situations it may be desirable for the charger not to check the battery voltage upon startup. With this charger this function is enabled by sliding dip switch 2 “Watch” to the left.

When this dip switch is positioned on the left, the charger will always

start charging in the boost mode.

When dip switch 2 “Watch” is positioned on the right, it is checked upon startup whether the battery voltage is sufficiently high to enable a start in the float mode. If it is not, the charger is started in the boost mode as yet.

4.10 Connecting the output voltage alarm

The charger is equipped with a potential free alarm contact (change over type).

If the battery voltage is between V_{min} and V_{max} the contact is activated.

(See figure 8, remote connections: NO, NC, COM).

Model	V_{min}	V_{max}
12V	11,9 Vdc	16,8 Vdc
24V	23,8 Vdc	33,5 Vdc
48V	47,6 Vdc	67 Vdc

4.11 Connecting remote panels

Victron Energy provides four optional remote panels that can be connected to the charger.

See illustration 8 for the circuit board connector where the remote panels have to be connected to.

The COV panel:

The maximum charging current of 30A or 50A, according to the model, can be limited with an external panel. This panel, the Victron Energy COV panel, contains an adjustable potentiometer. Limiting the maximum charging current can be useful to meet the batteries specifications, or to make sure the shore fuse does not blow.

To connect the panel:

- ☐ Disconnect the mains.
- ☐ Connect the panel to the “+ pot” and “-pot” connector.

The CMV panel:

This panel indicates the charging mode and possible failures.

To connect the panel:

- ☐ Disconnect the mains.
- ☐ Connect the boost led to the “L_BO” connector.
- ☐ Connect the equalize led to the “L_EQ” connector.
- ☐ Connect the float led to the “L_FL” connector.
- ☐ Connect the failure led to the “L_FA” connector.
- ☐ Connect the ground of the panel to the “GND” connector.

The CSV panel:

With the CSV panel the charger can be switched on or off. On the panel a green “on” led is present. To operate the CSV panel you first have to switch the charger on with the on/off switch located on the front panel of the charger.

To connect the panel:

- ☐ Disconnect the mains
- ☐ Connect the on led to the “L_ON” connector.
- ☐ Connect the ground of the panel to the “GND” connector.
- ☐ Connect the connection “TG switch” to the “REM” connector.

The SKC panel:

This panel indicates if the charger is on or off, it indicates the charging mode and it contains an adjustable potentiometer. Limiting the maximum charging current can be useful to more accurately charge the batteries according the manufacturers specifications, or to make sure the shore fuse does not blow.

To connect the panel:

- ☐ Disconnect the mains
- ☐ Connect the on led to the “L_ON” connector.
- ☐ Connect the boost led to the “L_BO” connector.
- ☐ Connect the float led to the “L_FL” connector.
- ☐ Connect the ground of the panel to the “GND” connector.
- ☐ Connect current control to the “+ POT” and “-POT” connector.

4.12 Connecting a remote on/off switch

A remote switch can be connected to the charger so the charger can be switched on and off from a remote location. To operate the switch, first switch the charger on with the on/off switch located on the charger.

To connect the remote on/off switch:

- ☐ Disconnect the mains
- ☐ Connect the switch in between the “REM” and the “GND” connector.

4.13 Connecting a remote boost switch

A remote switch can be connected to the charger so the charger can be switched permanently into the boost-charge mode. Due to parallel loads connected to the battery it is advised to switch the charger into the permanent boost-charging mode in order not to discharge the battery.

If the switch is closed the charger switches into the permanent boost-charge mode. If the switch is opened again the charger will automatically go to the float-charge mode. This in order not to overcharge a battery with charging it to long with higher charging voltage.

To connect the boost switch:

- ☐ Disconnect the mains.
- ☐ Connect one pole of the switch to the “RBOO” connector.

- ❑ Connect the other pole of the switch to the “GND” connector.

4.14 Connecting a voltmeter

The remote-connector offers a possibility to connect a voltmeter. It is possible to connect a digital as well as a analogue voltmeter. This output can only be used when the voltage-sense is connected. The voltage at this output is equal to the voltage measured at the point where the voltage sense wires are connected.

Connecting a voltmeter

- ❑ Disconnect the mains voltage.
- ❑ Make sure that the voltage sense wires are connected, see chapter 4.8.
- ❑ Connect a black wire between the “-” connection of the voltmeter and “-VM” at the remote connector.
- ❑ Connect a red wire between the “+” connection of the voltmeter and “+VM” at the remote connector.
- ❑ Connect the mains voltage.

4.15 Connecting a ampèremeter

The remote connector offers a possibility to connect an ampèremeter, which indicates the output current of the charger. For the 30A models an ampèremeter, which indicates 30A at 60mV input voltage is required. For the 50A models an ampèremeter, which indicates 50A at 60mV input voltage is required.

Connecting a ampèremeter

- ❑ Disconnect the mains voltage.
- ❑ Connect a black wire between the “-” connection of the ampèremeter and “-AM” at the remote connector.
- ❑ Connect a red wire between the “+” connection of the ampèremeter and “+AM” at the remote connector.
- ❑ Connect the mains voltage.

5. FAULT TRACING

When a fault occurs in the battery charger, the following table can be used in order to find the fault. Before the Titan is being checked, make sure that all the devices connected to the battery charger are removed. If the fault can not be solved contact your Victron Energy dealer.

Problem	Possible cause	Solution
The charger does not operate	The mains voltage has to be between 185Vac and 265 Vac. (For the 24/30 110V, between: 93,5 and 132 Vac).	Measure the mains voltage and make sure it is in between 185Vac and 265Vac. (For the 24/30 110V, between: 93,5 and 132 Vac).
The battery is not being fully charged	A broken input fuse.	Return the charger to your dealer.
	The equalize-charge mode is set to a too short period.	Set the equalize-charge mode to a longer time.
	A bad battery connection.	Check the battery connections.
	The boost charge voltage is set to a wrong value.	Adjust the boost charge voltage to the right value.
	The float charge voltage is set to a wrong value.	Adjust the float charge voltage to the right value.
	The battery temperature is too high.	Connect the temperature sensor.
	The capacity of the battery is too large.	Connect a battery with a smaller capacity or install a larger charger.
The battery is being overcharged	The output fuses are broken.	Replace the output fuses.
	The battery charger is set into the permanent boost-charge mode.	Deselect the permanent boost DIP-switch (Rboost).
	The boost charge voltage is set to a wrong value.	Adjust the boost charge voltage to the right value.
	The float charge voltage is set to a wrong value.	Adjust the float charge voltage to right value.
	A bad battery.	Check the battery.
The failure led illuminates	The battery is too small.	Reduce the charge current.
	The charger is switched off as a result of a high ambient temperature.	Place the charger in a cooler, or better ventilated place.
The failure led flashes	The charger is reducing the output current as a result of a high ambient temperature.	Place the charger in a cooler, or better ventilated place.
The failure led flashes in a code ¹	The output fuses are broken.	Replace the output fuses.
The failure led illuminates in combination with a blinking on/off led	There is a voltage drop higher than 2V across the battery cables.	Turn the charger off, replace battery cables and connect them well.

The cover of the Titan may only be removed by a qualified technician. Before obtaining access to the Titan the mains supply circuit must be disconnected.

¹ Flashing code sequence is two times on in one second and then one second off.

6. TECHNICAL SPECIFICATIONS

6.1 General

Switch on behaviour	Charger can switch on under every load
Efficiency 12/50	83 % at 230Vac and 15Vdc 50A
24/30	85 % at 230Vac and 30Vdc 30A
24/30 110V	82 % at 110Vac and 30Vdc 30A
24/50	85 % at 230Vac and 30Vdc 50A
48/25	85 % at 230Vac and 60Vdc 25A
Temperature range	0 °C until +40 °C, decreasing output power if temperature > +40°C
EMC	According Council Directive 89/336 EEG
Emission	EN 55014 (1993) EN 61000-3-2 (1995) EN 61000-3-3 (1995)
Immunity	EN 55104 (1995)
Vibration	IEC 68-2-6 (1982)
Safety	EN 60335-2-29 (1991)

6.2 Input

Input voltage range	185 - 265 Vac, full output power available Except 24/30 110V: 93,5-132 Vac, full output power available.
Frequency range	45 - 65 Hz, full output power available
Maximum Input current	At 230Vac input voltage :
model: 12/50	4A at 15V / 50A
24/30	4A at 30V / 30A
24/30 110V	8.5A at 30V / 30A (110Vac input voltage)
24/50	8A at 30V / 50A
48/25	8A at 60V / 25A
Input fuse	
model: 12/50, 24/30	250Vac / 8A fast 6,3x32mm, or equivalent
24/30 110V, 24/50, 48/25	250Vac / 12A fast 6,3x32mm, or equivalent
Cos phi / power factor	1,0

6.3 Output

Model	TG 12/50	TG 24/30 24/30 110V	TG 24/50	TG 48/25
Boost charge voltage	14,25Vdc	28,50 Vdc	28,50 Vdc	57 Vdc
Float charge voltage	13,25Vdc	26,50 Vdc	26,50 Vdc	53 Vdc
Output voltage range	12-16,5Vdc	24-33Vdc	24-33Vdc	48-66Vdc
Output voltage range supply mode ²	0-16Vdc	0-33Vdc	0-33Vdc	0-66Vdc
Charge characteristic	IUoUo	IuoUo	IUoUo	IUoUo

² Contact your Victron Energy dealer for this option.

Model	TG 12/50	TG 24/30 24/30 110V	TG 24/50	TG 48/25
Voltage compensation for diode-splitter, via DIP-switch	+ 0,6 V	+ 0,6 V	+ 0,6 V	+ 0,6 V
Current/voltage stability	± 1 %	± 1 %	± 1 %	± 1 %
Boost charge voltage compensation for traction battery, via DIP-switch	+ 1,0 V	+ 2,0 V	+ 2,0 V	+ 4,0 V
Maximum output current	50A	30A	50A	25A
Output current range	0-50A	0-30A	0-50A	0-25A
Output voltage ripple measured with a 30A or 50A resistive load	<100mVtt	<100mVtt	<100mVtt	<200mVtt
Maximum output power	750W	750W	1500W	1500W
Short circuit current	55A	27,5A	55A	27,5A
Maximum starter battery current	4A	4A	4A	n/a
High battery alarm relay	16,8 Vdc ± 0,4Vdc	33.5Vdc ± 0,8Vdc	33.5Vdc ± 0,8Vdc	67 Vdc ± 1,6Vdc
Low battery alarm relay	11,9 Vdc ±0,4Vdc	23,8 Vdc ±0,8Vdc	23,8 Vdc ±0,8Vdc	47,6 Vdc ±1,6Vdc
Output fuse (flat car fuse)	4 x 20A	2 x 20A	4 x 20A	other *
Leakage current from battery when the battery charger is turned off	≤ 3,2 mA	≤ 3,2 mA	≤ 3,2 mA	≤ 3,2 mA

* 6,3mm x 32mm 30A fuse

6.4 Mechanical

Cabinet	Aluminium sea water resistant
Protection	IP 21
Colour	Blue (RAL5012), epoxy coated
Dimensions	365 x 250 x 147mm
Dimensions including box	435 x 320 x 217mm
Weight	5,5 Kg
Weight including box	6,4 Kg
Input 230Vac connection	Connection block, suitable for wires up to 4 mm²
Battery connection	M8 bolts
Earth connection	M5 hole at bottom of the cabinet
Temperature sensor connection	Connection block
Starter battery connection	Connection block, suitable for wires up to 1,5mm²
Cooling	Forced air cooling
Noise	< 45dB(A)
Relative humidity	95% (maximal)

All measurements in mm.
